

Append.B: QuadOpt: A MathCad program for Excitations Current Optimization using gaussian beams representation

**PartI: Quad excitation calculation - solution #1**

**I.1 Description of the program**

*QuadOpt calculates the excitation currents  $I_1, I_2, I_3, I_4$  of the four quadrupoles, which focus the beam from the acceleration tube exit into the wiggler.*

*Fig. 1 Schematic of the beam-focusing model*

The program is based on the Gaussian beam model in optics (using the analogy) and the ABCD law.

The ABCD matrix of the quad system is defined between the “effective” (not geometrical) ends of the first and fourth quads. It is composed of analytical expressions for the paraxial ABCD matrices of the quads as function of their currents.

Assuming that we know the waist dimensions and positions before and after the quads:  $W_{01x}, W_{01y}, W_{02x}, W_{02y}, d_{inx}=d_{iny}=d_{in}, d_{outx}, d_{outy}$ . The program writes an equation relating the input and output waist dimensions using the ABCD law, and solves it for the excitation currents of the four quad currents. The solution is performed by an iterative process starting from an initial “guess” set of currents. From symmetry considerations two sets of solutions are expected.

Notes:

1. See Append for description of an ELOP procedure for calculating the goal output (virtual) waist parameters  $W_{02}, W_{02}$  and their positions  $Z_{wx}, Z_{wy}$ . ( $Z_{wx}, Z_{wy}$  are the waist positions relative to the center of the wiggler, from which the program calculates  $d_{outx}, d_{outy}$ ).
2. In the present version it is assumed that the  $d_{in}=d_{iny}=d_{inb}$  and that the beam is at its waist exactly at the position of the screen  $S$  located right after acceleration tube.
3. Because presently both the wiggler and the quads setting is symmetric relative to the wiggler center, the same program can be used to determine also the currents  $I_5-I_8$ : by symmetry  $I_5=I_4, I_6=I_3, I_7=I_2, I_8=I_1$ . Alternatively one can find a different solution, if different waist size  $W_0$  and position coordinate ( $Z_s$ ) are required at the deceleration tube entrance, by operating QuadOpt again with the appropriate parameters.

I.2 Input Parameters

The parameters that frequently changed are listed here. All axial coordinates are relative to the wiggler center (absolute values).

Insert the desirable parameters (metric system):

$\epsilon := \pi \cdot 2.223033346 \cdot 10^{-5}$	[m*rad]	-emittance
$Z_s := 2.681$	[m]	
$w01x := 0.0075$	[m]	
$w01y := 0.0075$	[m]	
$Z_{wx} := 0.600$	[m]	
$Z_{wy} := 0.544$	[m]	
$w02x := 0.0010965$	[m]	
$w02y := 0.00108$	[m]	

Insert the initial "guess' currents set:

$I1 := 1.5$	[A]
$I2 := 1.2$	[A]
$I3 := 1.25$	[A]
$I4 := 0.7$	[A]

### I.3 Fixed Input Parameters

The parameters that are not changed often are:

#### General Data:

$$c := 2.9979 \cdot 10^8 \quad [\text{m/s}] \quad - \text{velocity of light}$$

$$q_e := 1.6022 \cdot 10^{-19} \quad [\text{coul}] \quad - \text{electron charge}$$

$$m_e := 9.1095 \cdot 10^{-31} \quad [\text{Kg}] \quad - \text{electron mass}$$

$$i := \sqrt{-1}$$

#### Electron Beam Parameters:

$$V := 1.4 \cdot 10^6 \quad [\text{V}] \quad - \text{beam energy}$$

$$\gamma := \frac{q_e \cdot V}{m_e \cdot c^2} + 1 \quad \gamma = 3.73978156187106 \quad - \text{relativistic } \gamma$$

$$\beta := \sqrt{1 - \frac{1}{\gamma^2}} \quad \beta = 0.964 \quad - \text{relativistic } b$$

### I.4 Quads Configuration

$$dB_{drdI} := 0.15221 \quad [\text{Tesla/(A*m)}] \quad - \text{quad magnetic field gradient}$$

$$a := \frac{q_e \cdot dB_{drdI}}{\gamma \cdot m_e \cdot \beta \cdot c} \quad a = 24.781 \quad [1/(\text{Am})^2] \quad - \text{quad general parameter}$$

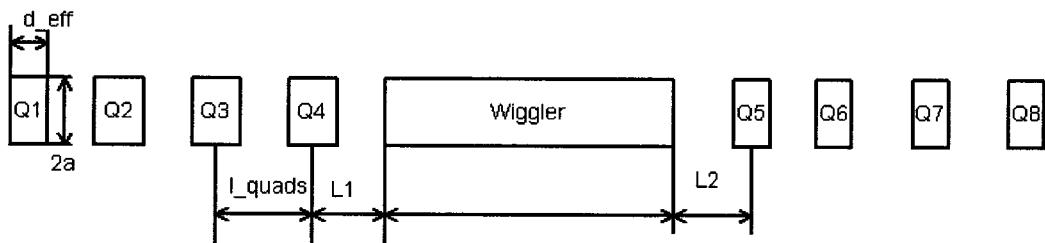

Fig.2 Quads configuration parameters

## Quads Configuration Dimensions

$l_{\text{quads}} := 0.345$

[m]

$L1 := 0.497$

[m]

$L2 := 0.497$

[m]

$Lwig := 1.200$

[m]

$d_{\text{eff}} := 0.14$

[m] - quad width

$$d_{\text{in}} := 2.681 - \frac{Lwig}{2} - L1 - 3 \cdot l_{\text{quads}} - \frac{d_{\text{eff}}}{2} \quad d_{\text{in}} = 0.479 \quad [m] \quad - \text{input free-space}$$

$$d := l_{\text{quads}} - d_{\text{eff}} \quad d = 0.205 \quad [m] \quad - \text{free_space between quads}$$

del x,y is the position of the beam virtual waist in the x,y dimension relative to the end of the wiggler.

$$\text{delx} := \frac{Lwig}{2} - Zwx \quad \text{dely} := \frac{Lwig}{2} - Zwy$$

Output Distance:

$$doutx := \left( L1 - \frac{d_{\text{eff}}}{2} \right) + \text{delx} \quad doutx = 0.427 \quad [m] \quad - \text{output free-space}$$

$$douty := \left( L1 - \frac{d_{\text{eff}}}{2} \right) + \text{dely} \quad douty = 0.483 \quad [m]$$

## I.5 Calculations of Quads System ABCD Matrix

Elements matrices:

$$D_{in} := \begin{pmatrix} 0 & din \\ 1 & 1 \end{pmatrix} \quad D_{outx} := \begin{pmatrix} 0 & doutx \\ 1 & 1 \end{pmatrix} \quad D_{outy} := \begin{pmatrix} 0 & douty \\ 1 & 1 \end{pmatrix} \quad D := \begin{pmatrix} 0 & d \\ 1 & 1 \end{pmatrix} \text{ - free space matrices}$$

$$Mc(I) := \begin{pmatrix} \cos(\sqrt{a \cdot I} \cdot d_{eff}) & \frac{1}{\sqrt{a \cdot I}} \cdot \sin(\sqrt{a \cdot I} \cdot d_{eff}) \\ -\sqrt{a \cdot I} \cdot \sin(\sqrt{a \cdot I} \cdot d_{eff}) & \cos(\sqrt{a \cdot I} \cdot d_{eff}) \end{pmatrix} \quad \text{- quad converging matrix}$$

$$Md(I) := \begin{pmatrix} \cosh(\sqrt{a \cdot I} \cdot d_{eff}) & \frac{1}{\sqrt{a \cdot I}} \cdot \sinh(\sqrt{a \cdot I} \cdot d_{eff}) \\ \sqrt{a \cdot I} \cdot \sinh(\sqrt{a \cdot I} \cdot d_{eff}) & \cosh(\sqrt{a \cdot I} \cdot d_{eff}) \end{pmatrix} \quad \text{- quad diverging matrix}$$

4 quads x- and y- ABCD matrices:

$$M4qy(I1, I2, I3, I4) := \begin{pmatrix} 1 & douty \\ 0 & 1 \end{pmatrix} \cdot Mc(I4) \cdot \begin{pmatrix} 1 & d \\ 0 & 1 \end{pmatrix} \cdot Md(I3) \cdot \begin{pmatrix} 1 & d \\ 0 & 1 \end{pmatrix} \cdot Mc(I2) \cdot \begin{pmatrix} 1 & d \\ 0 & 1 \end{pmatrix} \cdot Md(I1) \cdot \begin{pmatrix} 1 & din \\ 0 & 1 \end{pmatrix}$$

$$M4qx(I1, I2, I3, I4) := \begin{pmatrix} 1 & doutx \\ 0 & 1 \end{pmatrix} \cdot Md(I4) \cdot \begin{pmatrix} 1 & d \\ 0 & 1 \end{pmatrix} \cdot Mc(I3) \cdot \begin{pmatrix} 1 & d \\ 0 & 1 \end{pmatrix} \cdot Md(I2) \cdot \begin{pmatrix} 1 & d \\ 0 & 1 \end{pmatrix} \cdot Mc(I1) \cdot \begin{pmatrix} 1 & din \\ 0 & 1 \end{pmatrix}$$

$$q1x := i \cdot \pi \cdot \frac{w01x^2}{\epsilon} \quad \text{-Initial qx and qy}$$

$$q1y := i \cdot \pi \cdot \frac{w01y^2}{\epsilon}$$

$$q2x(I1, I2, I3, I4) := \frac{M4qx(I1, I2, I3, I4)_{0,0} \cdot q1x + M4qx(I1, I2, I3, I4)_{0,1}}{M4qx(I1, I2, I3, I4)_{1,0} \cdot q1x + M4qx(I1, I2, I3, I4)_{1,1}}$$

-final qx and qy

$$q2y(I1, I2, I3, I4) := \frac{M4qy(I1, I2, I3, I4)_{0,0} \cdot q1y + M4qy(I1, I2, I3, I4)_{0,1}}{M4qy(I1, I2, I3, I4)_{1,0} \cdot q1y + M4qy(I1, I2, I3, I4)_{1,1}}$$

S

$$q_{2x}(I_1, I_2, I_3, I_4) := \frac{1}{q_{2x}(I_1, I_2, I_3, I_4)}$$

$$q_{2y}(I_1, I_2, I_3, I_4) := \frac{1}{q_{2y}(I_1, I_2, I_3, I_4)}$$

$$q_{2x}(I_1, I_2, I_3, I_4) = -1.358 - 0.556i$$

$$q_{2y}(I_1, I_2, I_3, I_4) = 6.266 - 2.49i$$

-final parameters values

### I.6 Solution#1 for $I_1, I_2, I_3, I_4$

Given

$$\frac{M4qx(I_1, I_2, I_3, I_4)_{0,0}}{M4qx(I_1, I_2, I_3, I_4)_{1,1}} = \left( \frac{w02x}{w01x} \right)^2$$

$$\frac{M4qy(I_1, I_2, I_3, I_4)_{0,0}}{M4qy(I_1, I_2, I_3, I_4)_{1,1}} = \left( \frac{w02y}{w01y} \right)^2$$

$$\frac{M4qx(I_1, I_2, I_3, I_4)_{0,1}}{M4qx(I_1, I_2, I_3, I_4)_{1,0}} = \left( \frac{\pi}{\epsilon} \right)^2 \cdot (w01x \cdot w02x)^2$$

$$\frac{M4qy(I_1, I_2, I_3, I_4)_{0,1}}{M4qy(I_1, I_2, I_3, I_4)_{1,0}} = \left( \frac{\pi}{\epsilon} \right)^2 \cdot (w01y \cdot w02y)^2$$

$$I_3 > 0$$

$$I := \text{Find}(I_1, I_2, I_3, I_4)$$

$$I = \begin{pmatrix} 1.60176 \\ 1.19662 \\ 1.31102 \\ 0.68961 \end{pmatrix}$$

-Solution

### I.7 Check Solution

A. This confirms that  $q(Zw) = iZR$  (waist position)

$$\begin{aligned} q_{2x}(I_0, I_1, I_2, I_3) &= -18.49i & q_{2x} := \frac{1}{q_{2x}(I_0, I_1, I_2, I_3)} & ZRx := \pi \cdot \frac{w02x^2}{\epsilon} \\ q_{2y}(I_0, I_1, I_2, I_3) &= -19.059i & q_{2y} := \frac{1}{q_{2y}(I_0, I_1, I_2, I_3)} & ZRy := \pi \cdot \frac{w02y^2}{\epsilon} \end{aligned}$$

$$q_{2x} = 0.054i \quad ZRx = 0.054$$

$$q_{2y} = 0.052i \quad ZRy = 0.052$$

### B. Current Variation

Here we vary  $I_4$  only, keeping  $I_1-I_3$  fixed, and confirm that the spot sizes  $W_{2x}(Z_{wx})$   $W_{2y}(Z_{wy})$  are minimal for our  $I_4$  solution.

$$q_{2x}(I_1, I_2, I_3, I_4) := \frac{M4qx(I_1, I_2, I_3, I_4)_{0,0} \cdot q1x + M4qx(I_1, I_2, I_3, I_4)_{0,1}}{M4qx(I_1, I_2, I_3, I_4)_{1,0} \cdot q1x + M4qx(I_1, I_2, I_3, I_4)_{1,1}}$$

final qx and qy

$$q_{2y}(I_1, I_2, I_3, I_4) := \frac{M4qy(I_1, I_2, I_3, I_4)_{0,0} \cdot q1y + M4qy(I_1, I_2, I_3, I_4)_{0,1}}{M4qy(I_1, I_2, I_3, I_4)_{1,0} \cdot q1y + M4qy(I_1, I_2, I_3, I_4)_{1,1}}$$

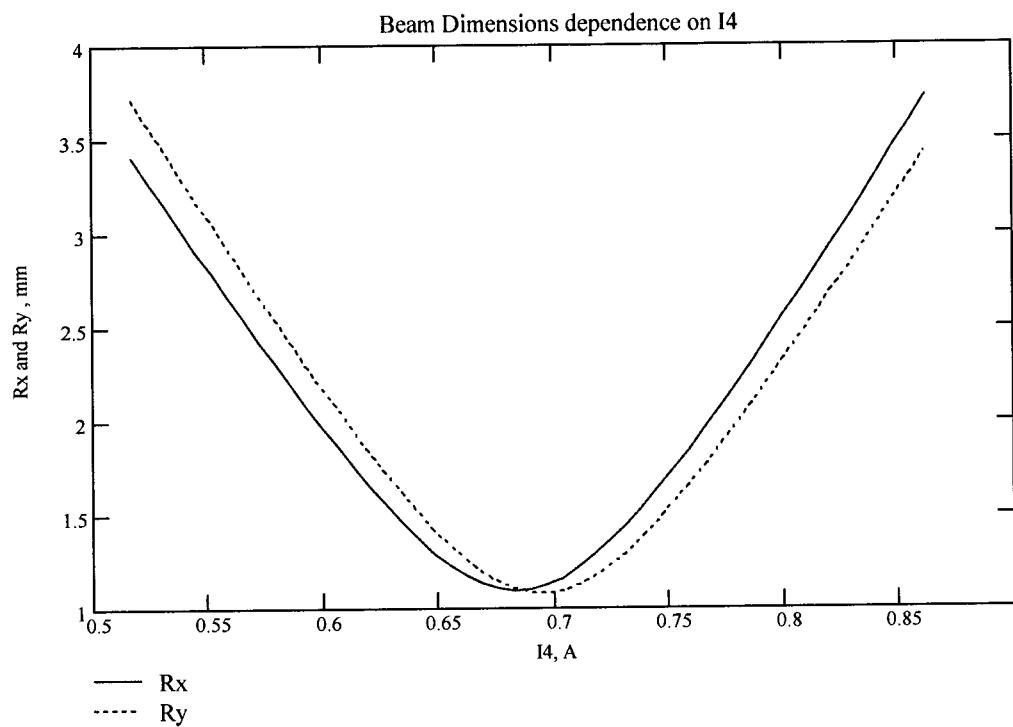

$$q_{2x}(I_1, I_2, I_3, I_4) := \frac{1}{q_{2x}(I_1, I_2, I_3, I_4)} \quad q_{2y}(I_1, I_2, I_3, I_4) := \frac{1}{q_{2y}(I_1, I_2, I_3, I_4)}$$

$$rx(I_1, I_2, I_3, I_4) := \sqrt{\frac{\epsilon}{-\pi \cdot \text{Im}(q_{2x}(I_1, I_2, I_3, I_4))}} \quad ry(I_1, I_2, I_3, I_4) := \sqrt{\frac{\epsilon}{-\pi \cdot \text{Im}(q_{2y}(I_1, I_2, I_3, I_4))}}$$

$$I1 := I_0 \quad I2 := I_1 \quad I3 := I_2$$

$$k := 0..50 \quad I4_k := I_3 + (k - 25) \cdot \frac{I_3}{100}$$

Beam Size as function of quads currents

I1 = 1.602

I2 = 1.197

I3 = 1.311

**I4 = 0.689**
